

Custom Applications

All collars supplied by Dayton Superior Products are available with a wide variety of material and finishes. Materials would include: stainless steel, aluminum, brass, forgings, castings, plate steel, spring steel, and plastics. Finishes would include: zinc, black oxide, electra-coat, yellow zinc dichromate, and others.

All clutches are built to order from a substantial stock of parts that are fully inspected so that same day deliveries can be made in most cases. If special machining is required the delivery will be delayed due to the need for heat treating but most deliveries can be made in two weeks or less.

Our magnetic base work light (Duty Light) can be shipped the same day in most cases.

Our Thumb Punch Machine for the packaging industry requires two to three months since each machine is made to order according to the requirements of the customer.

For special parts made to the customer's prints we can supply a quote in three days and foreign delivery would normally be 150 days from the receipt of order.

These parts can be machined, steel, cast iron, cast steel, cast aluminum, stamped steel, stamped spring steel or any variety of material. Special parts can be imported (for low cost) or machined in our plant if lead time dictates. We run these parts on a wide variety of machinery including CNC lathes, CNC machining centers, automotive screw machines, grinders, CNC saw, special machinery to automatically manufacture split collars, and a substantial quantity of mills, drills, lathes, welders, etc.
